

PAGALAVAN M

Angular Developer — Frontend & Hybrid Mobile Applications

pagalavan25surya@gmail.com | +91-6379328923 | linkedin.com/in/pagalavanM | github.com/pagalavan-UI | Thanjavur, India

PROFESSIONAL SUMMARY

Angular Developer with 2.4+ years of experience (including an initial internship) building scalable, production-grade web and hybrid mobile applications using Angular 12+, TypeScript, and RxJS. As part of a 12-member cross-functional engineering team, owned frontend development end-to-end for a live multi-vendor e-commerce platform 500+ product listings, real paying users, JWT authentication, and Razor pay payment integration — while cutting initial load time by 35% through lazy loading and OnPush change detection. Designed and implemented OAuth 2.0 authentication across the web and Android apps the most technically demanding piece of the system I owned. Extended the same Angular codebase into a native Android app using Ionic and Capacitor, and contributed to a 20% faster release cycle through an Azure DevOps CI/CD pipeline. Comfortable owning a feature from component design and API integration through manual QA and production deployment in Agile/Scrum teams.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript (ES6+), HTML5, CSS3

Frameworks & Libraries: Angular 12+, Ionic 5/6, RxJS (Observables, Subjects, BehaviorSubjects), Angular Material, Bootstrap 5

Mobile Development: Ionic 5, Capacitor, Android Studio (single codebase for Android)

Architecture & Patterns: Component-Based Design, Lazy Loading, OnPush Change Detection, Reactive Forms, Service-Based State Management

API & Auth: RESTful APIs, JWT Authentication, OAuth 2.0, Razorpay SDK, Google Maps API, WhatsApp Business API

Internationalization: ngx-translate (i18n), Multi-Language UI, API-Driven Localization

Testing & Quality: Manual & Functional Testing, Cross-Browser/Device QA, Bug Triage before Release

DevOps & Tools: Git, GitHub, Azure DevOps Pipelines (CI/CD), Cloudflare, Postman, Swagger, VS Code, Android Studio

Databases: MySQL, SQL Server

Methodology: Agile/Scrum, Sprint Planning, Code Reviews, Full SDLC

WORK EXPERIENCE

Frontend Developer — Thanjai Cloud Technologies

Apr 2024 – Present

Thanjavur, India | Live product: Smart Deal Zone (multi-vendor e-commerce, web + Android) | 12-member cross-functional team

- **Signature Achievement — OAuth 2.0 Integration:** designed and implemented OAuth 2.0 authentication across both the Smart Deal Zone web platform and the Shopping Cart Android app, handling token exchange, refresh flows, and secure session handoff alongside JWT-based authorization — the most technically demanding piece of the system I owned end-to-end.
- **Component Architecture:** developed 20+ reusable Angular components using RxJS and Angular Material, enabling a scalable, maintainable architecture reused across every module of the platform.
- **State Management:** implemented service-based state management with RxJS Subjects/BehaviorSubjects to share and synchronize data across components, cutting redundant API calls.
- **Feature Development:** built core modules — order tracking and inventory management — with secure REST API integration and JWT authentication.
- **Payments & Notifications:** integrated the Razorpay payment gateway and WhatsApp Business API for real-time transaction processing and automated customer notifications.
- **Performance:** improved initial load performance by 35% using lazy loading and OnPush change detection.
- **Quality Ownership:** manually tested UI flows and core functionality across browsers and devices ahead of every deployment, catching regressions before they reached production.
- **Responsive UI:** designed mobile-first, responsive interfaces with Bootstrap and CSS3, ensuring consistent cross-browser behaviour.
- **Collaboration & Release:** worked in Git/GitHub feature-branch workflows (PRs, code reviews) inside an Agile/Scrum team, feeding an Azure DevOps CI/CD pipeline (Cloudflare-hosted) that cut release cycle time by 20%.

Frontend Developer Intern — Thanjai Cloud Technologies

Jan 2024 – Mar 2024

Thanjavur, Tamil Nadu, India

- **Onboarding & Fundamentals:** ramped up on the Smart Deal Zone Angular codebase, contributing to smaller UI components and bug fixes under senior developer guidance ahead of converting to a full-time Frontend Developer role.

KEY PROJECT — SMART DEAL ZONE: MULTI-VENDOR E-COMMERCE PLATFORM

Angular 12, TypeScript, Bootstrap 5, REST API, MySQL, Google Maps API

Public web platform for discovery, listings, and enquiries — offline/in-person purchase model; online ordering and checkout are exclusive to the companion Android app below.

- **Frontend Ownership:** owned the frontend layer for a city-based multi-vendor e-commerce platform (12-member team: frontend, backend, QA, and product) supporting 500+ active product listings and real users.
- **Merchant Onboarding:** built merchant onboarding flows with tiered subscription plans, dynamic storefronts, product galleries, and banner management.
- **Events Management Module:** built a public-facing module that surfaces nearby local events by location, with full event detail pages (venue, timing, description) — an additional discovery surface alongside the core marketplace.
- **Dynamic Form Builder:** designed and built a form builder letting public users submit queries through custom forms, with each submission automatically routed to the relevant client's dashboard — creating a self-serve lead-generation channel for merchants.
- **Category Module:** built a category-based browsing module where public users select a category and view all listed companies and their products under it, driving structured product discovery.
- **Multi-Language Support:** implemented multi-language UI using ngx-translate, fetching bundled translation data via API for 6 major Indian languages so content renders in the user's selected language without separate builds.
- **Service Provider Module:** built a service-provider registration and discovery flow for local services (e.g., plumbing, bike/car servicing) — providers register their profile under the platform, get admin-verified, and appear in a public module where users can search and submit a service-request form describing their issue; the request connects the user with an available provider based on real-time availability.
- **Cinema Booking Module:** built showtime discovery on the web platform, with live showtimes and seat selection/booking completed through the companion Android app via a unified API.

KEY PROJECT — SMART DEAL ZONE: ANDROID MOBILE APPLICATION

Ionic 5, TypeScript, Capacitor, REST API, Razor pay, Push Notifications, Android Studio

The exclusive online ordering channel for Smart Deal Zone — cart, checkout, payments, real-time tracking, and delivery-partner assignment all live here.

- **Cross-Platform Development:** built the Android app using Ionic and Angular from the same web codebase, improving development efficiency and maintainability.
- **Shopping Cart & Order Tracking:** built wishlist/favorites and cart logic (add/remove items, persist across sessions, real-time quantity sync) tied to an order-tracking system that supports both automatic status updates and manual status overrides — giving both the customer and admin live visibility into delivery progress.
- **Delivery Partner Network:** built an Instamart-style delivery model where independent delivery partners sign up with KYC details and get admin-verified before activation; once verified, admin assigns the nearest available partner (geolocation-based matching) to incoming orders, who picks up from the merchant and delivers to the customer. Delivery-partner accounts are role-restricted and kept separate from delivery-channel-owner/admin access.
- **Order Notifications & Cancellation Flow:** built automated email confirmations to both the client (merchant) and customer at each stage of the order, giving both sides end-to-end order visibility; also built a cancel-order flow with a cancellation-enquiry system to capture and track the reason behind each cancelled order.
- **Native Capabilities:** built delivery-partner workflows using push notifications and device-level features for proof-of-delivery.
- **Service Provider Access:** extended the service-provider discovery and request flow to the Android app, letting mobile users browse verified local service providers and submit service requests on the go.

EDUCATION

B.Com Computer Applications (B.Com CA) — Annai Vailankanni Arts & Science College | 2018 – 2021

Relevant coursework: Data Structures, DBMS, Web Technologies, Computer Networks

Frontend Web Development Training Program — Local Training Institute, Thanjavur | 2022 – 2023

Intensive, project-based training in HTML5, CSS3, JavaScript (ES6+), and Angular fundamentals — direct bridge from degree to industry role.

CERTIFICATIONS & CONTINUOUS LEARNING

- Active LeetCode practitioner (TypeScript) — 90+ problems solved, including backtracking, dynamic programming, and array optimization
- Data Structures in C — Great Learning
- Basic Figma UX Design — Great Learning
